

EARLY SIGNS OF BREAST CANCER

Know what to look for, and when to get it checked.

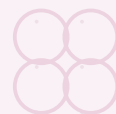

BROUGHT TO YOU BY

LOCK OF HOPES

INSIDE THIS GUIDE

- Why early detection matters
- Common and less common warning signs
- When to see a doctor, and how screening helps

PLEASE READ

This guide is for awareness only. It does not replace medical advice, diagnosis, or screening tests such as a mammogram.

1 Why early detection matters

Finding breast cancer early allows for simpler treatment and better outcomes. Symptoms are often painless at the start, which is exactly why staying aware of your body matters so much.

The earlier a change is found, the more treatment options are usually available.

2 Common early warning signs

Watch for these

- A new lump in the breast or underarm
- A change in breast size or shape
- Skin dimpling or redness
- A nipple turning inward, or other unusual changes
- Discharge that is not breast milk
- Persistent breast or nipple pain

3 Less common but important signs

Easy to miss, still worth checking

- Thickened skin or a rash on the breast
- Sudden swelling on one side only
- Warmth, heaviness, or unusual texture in the breast

These signs are less common, but they still matter. If something feels different from what is normal for you, it is worth getting checked, even if it does not match the list exactly.

4

When to see a doctor

Contact a doctor if you notice:

- A new lump that was not there before.
- A change that is getting worse over time.
- Blood stained discharge from the nipple.
- Anything that simply feels unusual for you.

Do not wait to see if it goes away on its own. When in doubt, get it checked.

5

Screening and prevention

Mammograms and regular screenings help detect cancers that are too small to feel by hand. Screening catches changes early, often before any symptoms appear at all.

- Screening schedules depend on your age, family history, and personal risk factors.
- Self-awareness and clinical screening work best together, neither replaces the other.

Talk to your doctor about a screening schedule that fits your risk level.

QUICK RECAP

Before you go

- Know what is normal for your body, so change is easier to spot.
- Most breast changes are not cancer, but any new or lasting change is worth a doctor visit.
- Self-awareness and regular screening work together. Neither one replaces the other.

Early detection saves lives.

Know the signs. Trust your instincts. Never wait it out when something feels wrong. A doctor can help.
